

ABSTRACT

A monitor is fastened on a vehicle seat of a motor vehicle.
The monitor is optically associated with the head restraint
and fastened on a frame part of the backrest. The monitor may
5 be swiveled independently of the position of the head
restraint. The arrangement of the head restraint parallel to
the monitor inhibits the vibration of the monitor during
operation of the motor vehicle and prevents the rear
passengers from being dazzled when watching the monitor at
10 night.
